

2-2-2: Examining Authorization and Access Control Models

At the end of this episode, I will be able to:

1. Identify and explain authorization and access control models, given a scenario.

Learner Objective: *Identify and explain authorization and access control models, given a scenario*

Description: In this episode, the learner will examine the process of authorization and access control models such as Discretionary Access Control, Role-based Access Control and more.

-
- What is authorization?
 - Granting or denying specific permissions and access rights to authenticated users or entities, controlling their actions within a system or resource.
 - How are these privileges and permissions granted?
 - Access control systems that implement common access control models
 - What types of access control models are we talking about?
 - Discretionary Access Control - a security model where data owners determine and manage access permissions to their resources.
 - Mandatory Access Control - a security model where access permissions are determined by a central authority based on predefined security labels or classifications
 - Role-based Access Control - a security model where access permissions are determined by a central authority based on predefined security labels or classifications
 - Rule-based access control - a security method where access decisions are determined by a set of explicitly defined rules or conditions
