

2-5-1: Examining Deception and Disruption Technology

At the end of this episode, I will be able to:

1. Identify and explain deception and disruption technologies, given a scenario.

Learner Objective: *Identify and explain deception and disruption technologies, given a scenario*

Description: In this episode, the learner will examine deceptive technologies used to lure potential attackers, such as honeypots and honeynets.

-
- Deception and disruption technologies
 - Honeyfile
 - A file or document placed on a network as bait to attract
 - Enables security professionals to attract and detect unauthorized access or exfiltration attempts.
 - This information can be studied to identify the techniques and potential intentions of bad actors without risking actual resources.
 - Honeytoken
 - A piece of fake or deliberately weak data placed within a system or network to act as a decoy.
 - Enables security professionals to spot potential unauthorized activity or security breaches.
 - This system information can be studied to identify techniques and potential intentions without risking actual network assets.
 - Honeypot
 - A deceptive system or network designed to attract and trap potential attackers
 - Enables security professionals to monitor the activities of bad actors/threat actors
 - This system information can be studied to identify techniques and potential intentions without risking actual network assets.
 - Honeynet
 - A network of honeypots designed to simulate a larger, more enticing target to lure and study attackers.
 - Enables security professionals to monitor and study the activities of bad actors/threat actors without risking actual network assets.
